

1. An absorbent article which defines a front waist section, a rear waist section, and an intermediate section which interconnects said front and rear waist sections, said absorbent article comprising:

an absorbent material containing, at least in part, a superabsorbent; and a second material;

wherein one or more regions of the article contains less absorbent material than other regions of the article, and wherein the second material is positioned in at least one of the one or more regions of article which contain less absorbent material.

2. The absorbent article of Claim 1, wherein the reduction of absorbent material and the positioning of the second material in one or more regions of the article promote flow of an insulating liquid from the one or more regions of the article containing less absorbent material to other regions of the article so as to change the fluid profile in the article.

3. The absorbent article of Claim 1, wherein the absorbent material is absent from one or more regions of the article.

4. The absorbent article of Claim 1, wherein the intermediate section comprises, at least in part, a crotch region and wherein the absorbent material is absent from the crotch region of the article.

5. The absorbent article of Claim 1, wherein the second material is selected from one or more of the group consisting of surge, tissue, or airlaid materials.

6. The absorbent article of Claim 1 further comprising one or more of the following:

(a) additional surge material, said additional surge material being positioned between the topsheet and the second material or the absorbent material; and

a vapor barrier, said vapor barrier positioned between the absorbent and the topsheet; wherein said vapor barrier reduces the amount of moisture exposed to the skin of a wearer.

7. The absorbent article of Claim 1, wherein the backsheet may be comprised of a highly breathable laminate.

8. The absorbent article of Claim 1, wherein the highly breathable laminate is a film/nonwoven laminate.
9. The absorbent article of Claim 8, wherein the nonwoven is a spunbond.
10. The absorbent article of Claim 6, wherein the vapor barrier is a film.
11. The absorbent article of Claim 1, wherein the backsheet has a Water Vapor Transmission Rate of at least 2,500 g/m²/24hr.
12. A composite system which defines a front waist section, a rear waist section, and an intermediate section which interconnects said front and rear waist sections, said system comprising:
 a superabsorbent-free material; and
 an absorbent, containing, at least in part a superabsorbent,
 wherein the absorbent is absent from one or more regions of the article; and
 wherein the superabsorbent-free material is positioned in one or more regions of the article adjacent the absorbent.
13. The composite system of Claim 12, wherein the absence of absorbent in one or more regions of the article and the presence of the superabsorbent-free material in those regions promotes a reduction in time to move the insult from the superabsorbent-free material to the absorbent.
14. The composite system of Claim 12, wherein the insult is removed from the superabsorbent-free material to the absorbent material in less than about 2 minutes.
15. The composite system of Claim 12, wherein the superabsorbent-free material comprises surge, tissue or airlaid materials.
16. A disposable absorbent article which comprises:

a vapor/permeable backsheet which defines a Water Vapor Transmission Rate of at least about 1000 grams per square meter per 24 hours calculated according to a Water Vapor Transmission Test as set forth herein;

a liquid permeable topsheet;

an absorbent body located between said backsheet and said topsheet, said absorbent body located in one or more regions of the article; and

a second material located between said backsheet and said topsheet, said second material being positioned in one or more regions of the article where the absorbent body is not present.

17. The absorbent article of Claim 16, wherein second material allows fluid to be moved away from an insult area of the absorbent article to a region of the absorbent article where the absorbent is located so as to change the fluid profile in the diaper.

18. The absorbent article of Claim 16, wherein the absorbent body is absent from the insult area of the absorbent article.

19. The disposable absorbent article of Claim 16 further comprising a vapor barrier positioned between the absorbent and the topsheet.

20. The absorbent article of Claim 19, wherein the vapor barrier is a film, and wherein the vapor barrier reduces the evaporation from the absorbent core into the absorbent article.

21. The absorbent article of Claim 16, wherein the second material is selected from the group consisting of surge, tissue or airlaid materials.

22. The absorbent article of Claim 16, wherein said vapor permeable backsheet is substantially liquid impermeable.

23. The absorbent article product of Claim 16 is a personal care product.

24. The personal care product of Claim 23, wherein the personal care product is selected from a diaper, training pant, absorbent underpant, adult incontinence product, feminine hygiene product, and hygiene products.
